EtraLED

EtraLED-96 Series φ96mm Material AL6063-T5 COB Star Heat Sinks Thermal Data

The thermal data table

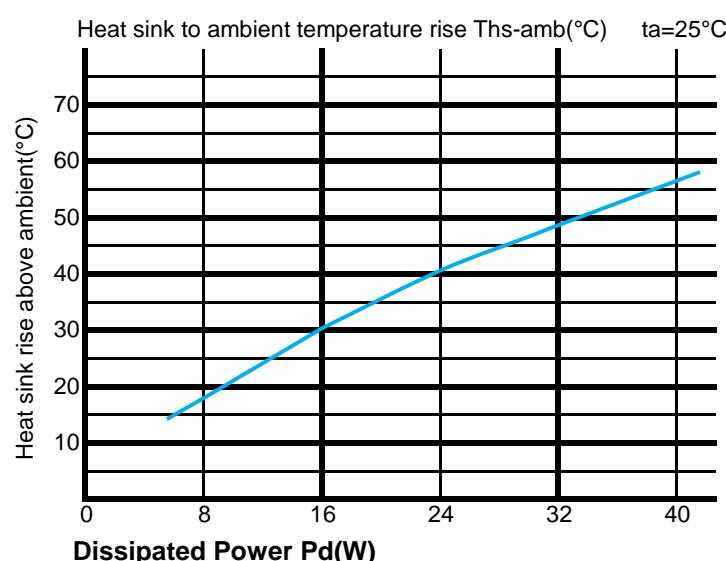

EtraLED-9620 thermal data

Pd = Pe x (1-ηL)	Heat sink to ambient thermal resistance Rhs-amb (°C/W)	Heat sink to ambient temperature rise Ths-amb (°C)
	EtraLED-9620	EtraLED-9620
Dissipated Power Pd(W)	6	3.33
	12	2.67
	18	2.28
	24	2.08
	30	1.81

EtraLED-9650 thermal data

Pd = Pe x (1-ηL)	Heat sink to ambient thermal resistance Rhs-amb (°C/W)	Heat sink to ambient temperature rise Ths-amb (°C)
	EtraLED-9650	EtraLED-9650
Dissipated Power Pd(W)	8	2.25
	16	1.88
	24	1.67
	32	1.5
	40	1.4

The thermal data table

EtraLED-9680 thermal data

Dissipated Power Pd(W)	Pd = Pe x (1-ηL)	Heat sink to ambient thermal resistance Rhs-amb (°C/W)	Heat sink to ambient temperature rise Ths-amb (°C)
		EtraLED-9680	EtraLED-9680
10		1.7	17
20		1.45	29
30		1.33	40
40		1.2	48
50		1.12	56

* Please be aware the dissipated power Pd is not the same as the electrical power Pe of a LED module.

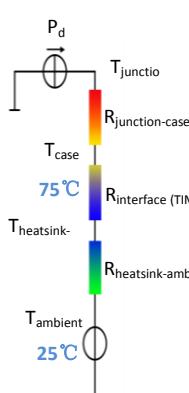

*To calculate the dissipated power please use the following formula: $P_d = Pe \times (1-\eta L)$.

Pd - Dissipated power ; Pe - Electrical power ; ηL = Light efficiency of the LED module;

*The aluminum substrate side of the package outer shell is thermally connected to the heat sink via TIM (Thermal interface material).

MingFa recommends the use of a high thermal conductive interface between the LED module and the LED cooler.

Either thermal grease,A thermal pad or a phase change thermal pad thickness 0.1-0.15mm is recommended.

*Thermal resistance is a heat property and a measurement of a temperature difference by which an object or material resists a heat flow.

Geometric shapes are different, the thermal resistance is different. Formula: $\theta = (Ths - Ta)/Pd$

θ - Thermal Resistance [°C/W] ; Ths - Heatsink temperature ; Ta - Ambient temperature ;

*The thermal resistance between the junction section of the light-emitting diode and the aluminum substrate side of the package outer

shell is $R_{junction-case}$, the thermal resistance of the TIM outside the package is $R_{interface(TIM)}$ [°C/W], the thermal resistance with the

heat sink is $R_{heatssink-ambient}$ [°C/W], and the ambient temperature is $T_{ambient}$ [°C].

*Thermal resistances outside the package $R_{interface(TIM)}$ and $R_{heatssink-ambient}$ can be integrated

into the thermal resistance $R_{case-ambient}$ at this point.Thus, the following formula is also used:

$$T_{junction} = (R_{junction-case} + R_{case-ambient}) \cdot Pd + T_{ambient}$$
